- **Team Name** – TrishulX

IDEA TITLE

MediKiosk – AI Voice & Touch Clinical History Kiosk with Medical Document OCR

❖ Proposed Solution (Describe your Idea/Solution/Prototype)

■ Detailed explanation of the proposed solution

■ How it addresses the problem

■ Innovation and uniqueness of the solution

- Patient-driven history + document digitisation in ONE flow – beyond admin check-in
- Safety path is rule-based: no LLM decides emergencies
- Every question answerable by voice OR touch – zero training
- Allopathic and AYUSH question trees in one engine
- Privacy-by-design: RFID card stores only a random ID; consent gates all data
- Same data feeds Rx-safety (NLEM 2022, Jan Aushadhi) and regional surveillance

TECHNICAL APPROACH

Technologies to be used (e.g. programming languages, frameworks, hardware)

Frontend	React 18, TypeScript, Vite, Tailwind CSS; Capacitor for the Android patient app
Backend	Node.js, Express, Socket.IO (real-time alerts), Prisma ORM, Zod validation
Database	CockroachDB (PostgreSQL-compatible); multi-hospital, consent-aware schema
Clinical AI	JSON clinical question trees + deterministic red-flag rules; NLEM-based Rx-safety engine
Speech & OCR	Web Speech API for voice in/out (Bhashini planned); Gemini Vision OCR with safe fallback
Hardware	Arduino Nano + MFRC522 RFID reader (USB serial); touchscreen PC / tablet; camera
Standards	FHIR R4 (ABDM / NRCeS profiles, demo mode); REST + WebSocket APIs

Methodology and process for implementation (Flow Charts/Images/ working prototype)

FEASIBILITY AND VIABILITY

Analysis of the feasibility of the idea

Problem-statement requirements vs. working prototype (23 items, our own code audit)

- Software-first: runs on a touchscreen PC / tablet + camera; RFID is a low-cost off-the-shelf module
- Working full-stack prototype already built (7 front-end apps + real-time backend)
- Speech, OCR and safety engines sit behind interfaces – swap in Bhashini or another OCR without redesign
- REST + FHIR path lets it sit beside existing registration / HIS instead of replacing it

Potential challenges and risks	Strategies for overcoming these challenges
Speech accuracy in noisy wards / accents	Touch is always available; Bhashini / AI4Bharat models via pluggable speech interface
OCR errors on handwriting	Confidence scores, 'needs verification' status, original image shown to doctor
Data protection (DPDP Act 2023)	Consent-first flow, audit log, no health data on RFID card, role-based access, idle timeout
Clinical correctness of questions	Clinician-reviewed trees; doctor confirms every summary; AI never diagnoses
Adoption & connectivity	Commodity hardware, touch fallback, REST/FHIR fit beside existing HIS; offline mode on roadmap

Phased rollout

IMPACT AND BENEFITS

4,000–10,000

OPD patients per day in tertiary hospitals

2–5 min

typical doctor time per patient

70–80%

of diagnoses possible from a good history

13

Indian languages in the patient interface

■ Potential impact on the target audience

- P

Patients
Shorter waits; history recorded in their own language; records kept digitally
- D

Doctors
Complete structured history on arrival; more time to examine and counsel
- N

Nurses & admins
Less registration / transcription work; emergencies flagged in real time
- A

AYUSH vaidyas
Dashavidha Pariksha captured without eating into consult time
- H

Health system
Structured, consented data for ABDM and public-health surveillance

Projected doctor-hours freed per day

= patients per day × minutes saved ÷ 60. Assumption: 1–2 min of history-taking saved per patient (to be validated in pilot)

■ Benefits of the solution (social, economic, environmental, etc.)

- SOCIAL

 - Inclusive for elderly, rural and low-literacy patients
 - Earlier detection of emergencies
 - Same access in 13 languages
- ECONOMIC

 - Doctor-hours freed (see chart)
 - Low-cost commodity hardware
 - Cheaper Jan Aushadhi generics suggested
- ENVIRONMENTAL

 - Paperless intake and digital records
 - Less paper for forms and repeated history

Sources: SIH 2026 problem statement 26047 (volumes, consultation time, 70–80% figure); doctor-hours chart is simple arithmetic on those volumes, not a measured result.
